

Web-based Geographic Information Systems (GIS) for Better Landfill Stewardship

Data is an asset, yet it is often stored away in files and folders rarely to be seen until someone needs an answer. Where was that file again? What folder? What year? Where was that reading taken and does that well still exist? Staff can spend hours searching for old files, compiling data from file to file, calculating metrics, and producing a result. Is this time well spent? What if there was an error in the data or the calculation? Using a web-based GIS as a central hub can provide organizations with a system to transform data into information and empower staff to make better decisions, operate more efficiently, save resources, and be better landfill stewards.
